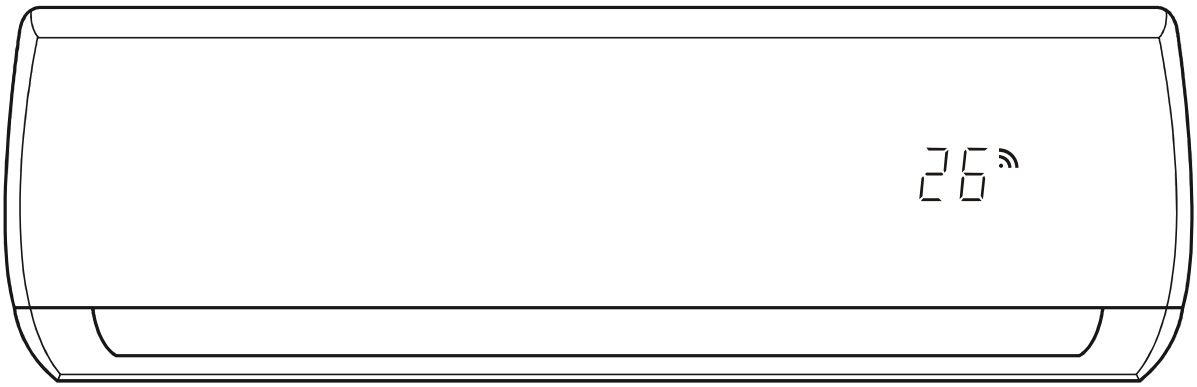
SM_BLANC(GA)_50R32_INVERTER_EU_NA_171214

BLANC INVERTER SERIES

2017 SERVICE MANUAL



R32

Maintenance and Disassembly

Contents

1. Maintenance

1.1 First Time Installation Check

Air and moisture trapped in the refrigerant system affects the performance of the air conditioner by:

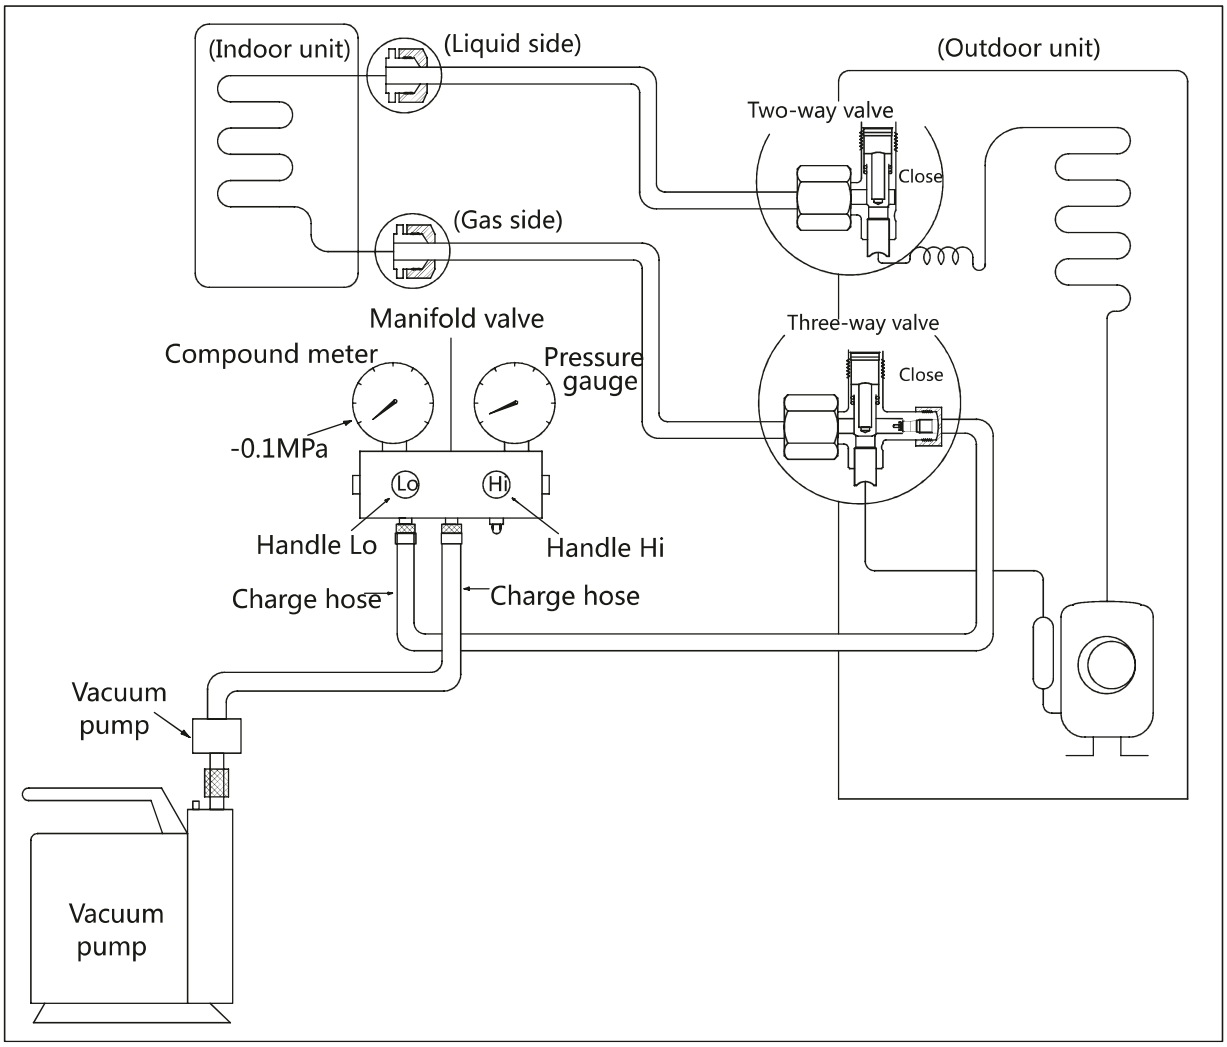
- Increasing pressure in the system.
- Increasing the operating current.
- Decreasing the cooling or heating efficiency.
- Congesting the capillary tubing due to ice build-up in the refrigerant circuit.
- Corroding the refrigerant system.

To prevent air and moisture from affecting the air conditioner's performance, the indoor unit, as well as the pipes between the indoor and outdoor unit, must be leak tested and evacuated.

Leak test (soap water method)

Use a soft brush to apply soapy water or a neutral liquid detergent onto the indoor unit connections and outdoor unit connections. If there is gas leakage, bubbles will form on the connection.

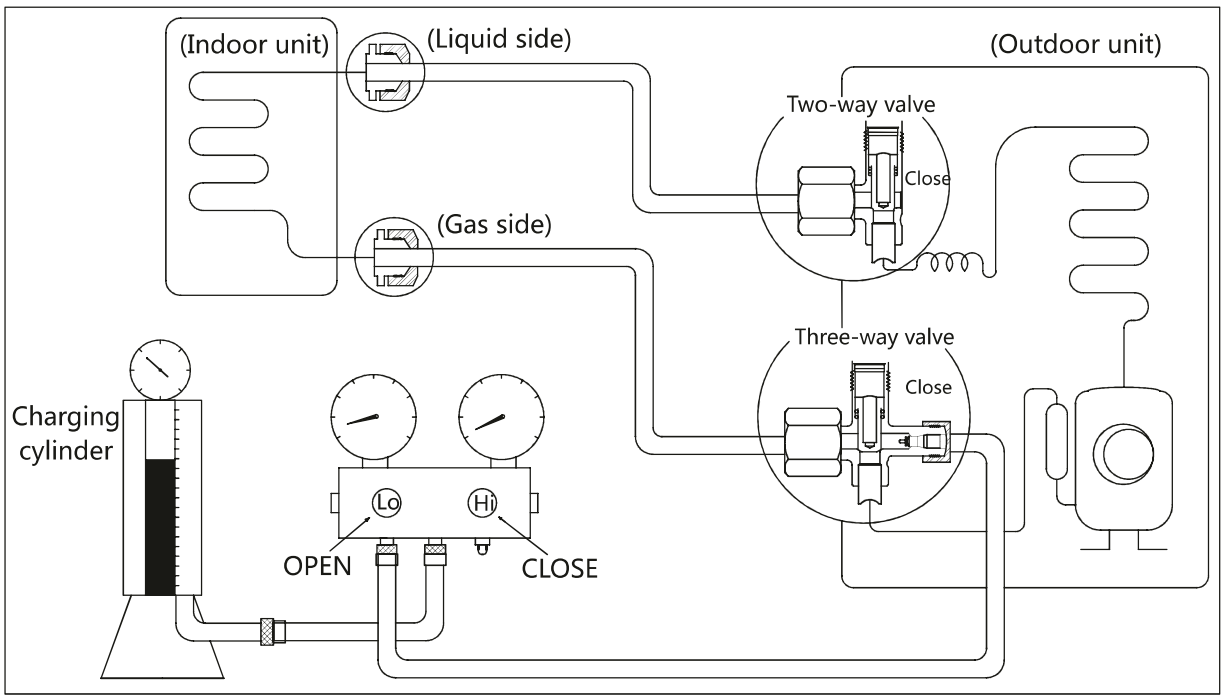
Air purging with vacuum pump



Procedure:

1. Tighten the flare nuts of the indoor and outdoor units, and confirm that both the 2- and 3-way valves are closed.
2. Connect the charge hose with the push pin of Handle Lo to the gas service port of the 3-way valve.
3. Connect another charge hose to the vacuum pump.
4. Fully open the Handle Lo manifold valve.
5. Using the vacuum pump, evacuate the system for 30 minutes.
   a. Check whether the compound meter indicates -0.1 MPa (14.5 Psi).
      - If the meter does not indicate -0.1 MPa (14.5 Psi) after 30 minutes, continue evacuating for an additional 20 minutes.
      - If the pressure does not achieve -0.1 MPa (14.5 Psi) after 50 minutes, check for leakage.
      - If the pressure successfully reaches -0.1 MPa (14.5 Psi), fully close the Handle Lo valve, then cease vacuum pump operations.
   b. Wait for 5 minutes then check whether the gauge needle moves after turning off the vacuum pump. If the gauge needle moves backward, check wether there is gas leakage.
6. Loosen the flare nut of the 3-way valve for 6 or 7 seconds and then tighten the flare nut again.
   a. Confirm the pressure display in the pressure indicator is slightly higher than the atmospheric pressure.
   b. Remove the charge hose from the 3-way valve.
7. Fully open the 2- and 3-way valves and tighten the cap of the 2- and 3-way valves.

1.2 Refrigerant Recharge



Prior to recharging the refrigerant, confirm the additional amount of refrigerant required using the following table:

Models	Standard length	Max. elevation	Max. length	Additional refrigerant
9k&12k	5m (16.4ft)	10m (32.8ft)	25m (82.0ft)	12g/m (0.13oz/ft)
18k	5m (16.4ft)	20m (65.6ft)	30m (98.4ft)	12g/m (0.13oz/ft)
24k	5m (16.4ft)	25m (82ft)	50m (164ft)	24g/m (0.26oz/ft)

Procedure:

1. Close both 2- and 3-way valves.
2. Slightly connect the Handle Lo charge hose to the 3-way service port.
3. Connect the charge hose to the valve at the bottom of the cylinder.
4. If the refrigerant is R410A, invert the cylinder to ensure a complete liquid charge.
5. Open the valve at the bottom of the cylinder for 5 seconds to purge the air in the charge hose, then fully tighten the charge hose with push pin Handle Lo to the service port of 3-way valve..
6. Place the charging cylinder onto an electronic scale and record the starting weight.
7. Fully open the Handle Lo manifold valve, 2- and 3-way valves.
8. Operate the air conditioner in cooling mode to charge the system with liquid refrigerant.
9. When the electronic scale displays the correct weight (refer to the gauge and the pressure of the low side to confirm), turn off the air conditioner, then disconnect the charge hose from the 3-way service port immediately..
10. Mount the caps of service port and 2- and 3-way valves.
11. Use a torque wrench to tighten the caps to a torque of 18 N.m.
12. Check for gas leakage.

Troubleshooting

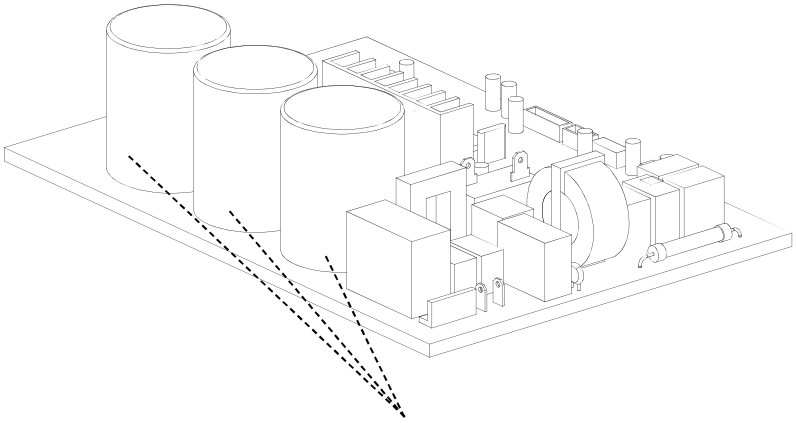
Contents

Contents

1. Safety Caution

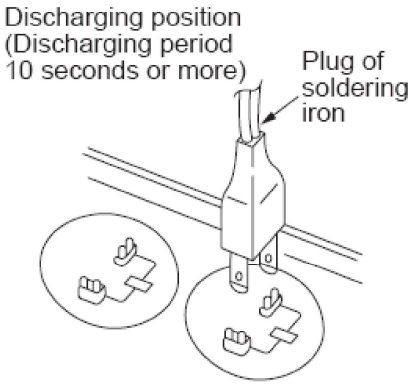
WARNING

Electricity remains in capacitors even when the power supply is off.
Ensure the capacitors are fully discharged before troubleshooting.



Electrolytic Capacitors

For other models, connect discharge resistance (approx.100Ω 40W) or a soldering iron plug between the positive and negative terminals of the electrolytic capacitor. The terminals are located on the bottom surface of the outdoor PCB.



Note: This picture is for reference only. Actual appearances may vary.

2. General Troubleshooting

2.1 Error Display (Indoor Unit)

When the indoor unit encounters a recognized error, the indicator light will flash in a corresponding series, the timer display may turn on or begin flashing, and an error code will be displayed. These error codes are described in the following table:

Display	LED STATUS	Solution
E0/ER	Indoor unit EEPROM parameter error	Page 73
E1	Indoor / outdoor units communication error	Page 74
E2	Zero-crossing signal detection error	Page 76
E3	The indoor fan speed is operating outside of the normal range	Page 77
E4	Indoor room temperature sensor T1 is in open circuit or has short circuited	Page 79
E5	Evaporator coil temperature sensor T2 is in open circuit or has short circuited	Page 79
Eb	Communication error between the indoor PCB and display board	Page 80
F0	Overload current protection	Page 81
F1	Outdoor ambient temperature sensor T4 open circuit or short circuit	Page 79
F2	Condenser coil temperature sensor T3 is in open circuit or has short circuited	Page 79
F3	Compressor discharge temperature sensor TP open circuit or short circuit	Page 79
F4	Outdoor unit EEPROM parameter error	Page 73
F5	Outdoor fan speed operating outside of the normal range	Page 77
P0	IPM malfunction or IGBT over-strong current protection	Page 82
P1	Over voltage or over low voltage protection	Page 83
P2	High temperature protection of IPM module	Page 84
P4	Inverter compressor drive error	Page 85

For other errors:

The display board may show a garbled code or a code undefined by the service manual. Ensure that this code is not a temperature reading.

Troubleshooting:

Test the unit using the remote control. If the unit does not respond to the remote, the indoor PCB requires replacement. If the unit responds, the display board requires replacement.

3. Error Diagnosis and Troubleshooting Without Error Code

WARNING

Be sure to turn off unit before any maintenance to prevent damage or injury.

3.1 Remote maintenance

SUGGESTION: When troubles occur, please check the following points with customers before field maintenance.

	Problem	Solution
1	Unit will not start	Page 66-67
2	The power switch is on but fans will not start	Page 66-67
3	The temperature on the display board cannot be set	Page 66-67
4	Unit is on but the wind is not cold(hot)	Page 66-67
5	Unit runs, but shortly stops	Page 66-67
6	The unit start ups and stops frequently	Page 66-67
7	Unit runs continuously but insufficient cooling(heating)	Page 66-67
8	Cool can not change to heat	Page 66-67
9	Unit is noisy	Page 66-67

3.2 Field maintenance

	Problem	Solution
1	Unit will not start	Page 68-69
2	Compressor will not start but fans run	Page 68-69
3	Compressor and condenser (outdoor) fan will not start	Page 68-69
4	Evaporator (indoor) fan will not start	Page 68-69
5	Condenser (Outdoor) fan will not start	Page 68-69
6	Unit runs, but shortly stops	Page 68-69
7	Compressor short-cycles due to overload	Page 68-69
8	High discharge pressure	Page 68-69
9	Low discharge pressure	Page 68-69
10	High suction pressure	Page 68-69
11	Low suction pressure	Page 68-69
12	Unit runs continuously but insufficient cooling	Page 68-69
13	Too cool	Page 68-69
14	Compressor is noisy	Page 68-69
15	Horizontal louver can not revolve	Page 68-69

1.Remote Maintenance	Electrical Circuit							Refrigerant Circuit						
Possible causes of trouble	Power failure	The main power tripped	Loose connections	Faulty transformer	The voltage is too high or too low	The remote control is powered off	Broken remote control	Dirty air filter	Dirty condenser fins	The setting temperature is higher/lower than the room's(cooling/heating)	The ambient temperature is too high/low when the mode is cooling/heating	Fan mode	SILENCE function is activated(optional function)	Frosting and defrosting frequently
Unit will not start	☆	☆	☆	☆										
The power switch is on but fans will not start			☆	☆	☆									
The temperature on the display board cannot be set						☆	☆							
Unit is on but the wind is not cold(hot)										☆	☆	☆		
Unit runs, but shortly stops					☆					☆	☆			
The unit starts up and stops frequently					☆						☆			☆
Unit runs continuously but insufficient cooling(heating)								☆	☆	☆	☆		☆	
Cool can not change to heat														
Unit is noisy														
Test method / remedy	Test voltage	Close the power switch	Inspect connections - tighten	Change the transformer	Test voltage	Replace the battery of the remote control	Replace the remote control	Clean or replace	Clean	Adjust the setting temperature	Turn the AC later	Adjust to cool mode	Turn off SILENCE function.	Turn the AC later

Check heat load			☆							Heavy load condition	Others
Tighten bolts or screws	☆									Loosen hold down bolts and / or screws	
Close all the windows and doors			☆							Bad airproof	
Remove the obstacles			☆	☆						The air inlet or outlet of either unit is blocked	
Reconnect the power or press **ON/OFF** button on remote control to restart								☆		Interference from cell phone towers and remote boosters	
Remove them	☆									Shipping plates remain attached	

2.Field Maintenance	Electrical Circuit														
Possible causes of trouble	Power failure	Blown fuse or varistor	Loose connections	Shorted or broken wires	Safety device opens	Faulty thermostat / room temperature sensor	Wrong setting place of temperature sensor	Faulty transformer	Shorted or open capacitor	Faulty magnetic contactor for compressor	Faulty magnetic contactor for fan	Low voltage	Faulty stepping motor	Shorted or grounded compressor	Shorted or grounded fan motor
Unit will not start	☆	☆	☆	☆	☆			☆							
Compressor will not start but fans run				☆		☆			☆	☆				☆	
Compressor and condenser (outdoor) fan will not start				☆		☆				☆					
Evaporator (indoor) fan will not start				☆					☆		☆				☆
Condenser (Outdoor) fan will not start				☆		☆			☆		☆				☆
Unit runs, but shortly stops										☆		☆			
Compressor short-cycles due to overload										☆		☆			
High discharge pressure															
Low discharge pressure															
High suction pressure															
Low suction pressure															
Unit runs continuously but insufficient cooling															
Too cool						☆	☆								
Compressor is noisy															
Horizontal louver can not revolve			☆	☆									☆		
Test method / remedy	Test voltage	Inspect fuse type & size	Inspect connections - tighten	Test circuits with tester	Test continuity of safety device	Test continuity of thermostat / sensor & wiring	Place the temperature sensor at the central of the air inlet grille	Check control circuit with tester	Check capacitor with tester	Test continuity of coil & contacts	Test continuity of coil & contacts	Test voltage	Replace the stepping motor	Check resistance with multimeter	Check resistance with multimeter

Replace the compressor														☆		Compressor stuck
Leak test				☆	☆		☆		☆	☆						Shortage of refrigerant
Replace restricted part				☆	☆					☆						Restricted liquid line
Clean or replace				☆	☆											Dirty air filter
Clean coil				☆	☆											Dirty evaporator coil
Check fan				☆	☆											Insufficient air through evaporator coil
Change charged refrigerant volume		☆				☆		☆	☆	☆						Overcharge of refrigerant
Clean condenser or remove obstacle				☆				☆	☆	☆						Dirty or partially blocked condenser
Purge, evacuate and recharge				☆				☆								Air or incompressible gas in refrigerant cycle
Remove obstruction to air flow				☆				☆								Short cycling of condensing air
Remove obstruction in air or water flow								☆								High temperature condensing medium
Remove obstruction in air or water flow								☆								Insufficient condensing medium
Replace compressor		☆														Broken compressor internal parts
Test compressor efficiency				☆		☆	☆									Inefficient compressor
Replace valve					☆											Expansion valve obstructed
Replace valve					☆					☆						Expansion valve or capillary tube closed completely
Replace valve					☆					☆						Leaking power element on expansion valve
Fix feeler bulb						☆										Poor installation of feeler bulb
Check heat load				☆		☆										Heavy load condition
Tighten bolts or screws		☆														Loosen hold down bolts and / or screws
Remove them		☆														Shipping plates remain attached
Choose AC of lager capacity or add the number of AC				☆												Poor choices of capacity
Rectify piping so as not to contact each other or with external plate		☆														Contact of piping with other piping or external plate

Refrigerant Circuit

Others

4. Quick Maintenance by Error Code

If you do not have the time to test whether specific parts are faulty, you can directly change the required parts according the error code.

You can find the parts to replace by error code in the following table.

Part requiring replacement	Error Code								
	E0	ER	E1	E3	E4	E5	Eb	F0	F1
Indoor PCB	✓	✓	✓	✓	✓	✓	✓	x	x
Outdoor PCB	x	x	✓	x	x	x	x	✓	✓
Reactor	x	x	✓	x	x	x	x	x	x
Indoor fan motor	x	x	x	✓	x	x	x	x	x
Outdoor fan motor	x	x	x	X	x	x	x	x	x
Temperature sensor	x	x	x	x	✓	✓	x	x	✓
Compressor	x	x	x	x	x	x	x	✓	x
IPM board	x	x	x	x	x	x	x	x	x
Display Board	x	x	x	x	x	x	✓	x	x
Outdoor unit	x	x	x	x	x	x	x	✓	x

Part requiring replacement	Error Code							
	F2	F3	F4	F5	P0	P1	P2	P4
Indoor PCB	x	x	x	x	x	x	x	x
Outdoor PCB	✓	✓	✓	✓	✓	✓	✓	✓
Reactor	x	x	x	x	x	✓	x	x
Indoor fan motor	x	x	x	x	x	x	x	x
Outdoor fan motor	x	x	x	✓	x	x	x	x
Temperature sensor	✓	✓	x	x	x	X	x	x
Compressor	x	x	x	x	✓	x	x	✓

Over Load Protector (OLP)	x	x	x	x	x	x	✓	x
Outdoor unit	x	x	x	x	x	x	x	x

5. Troubleshooting by Error Code

5.1 Common Check Procedures

5.1.1 Temperature Sensor Check

Disconnect the temperature sensor from PCB, measure the resistance value with a tester.

Temperature Sensors.

Room temp.(T1) sensor,

Indoor coil temp.(T2) sensor,

Outdoor coil temp.(T3) sensor,

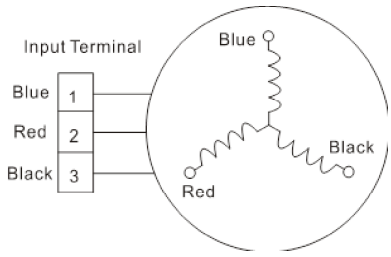
Outdoor ambient temp.(T4) sensor,

Compressor discharge temp.(Tp) sensor.

Measure the resistance value of each winding by using the multi-meter.

5.1.2 Compressor checking

Measure the resistance value of each winding by using the tester.



Position	Resistance Value		
	KSK89D53UEZ	KSM135D23UFZ	KTF235D22UMT
Blue - Red	2.35Ω(20°C/68°F)	1.28Ω(20°C/68°F)	0.75Ω(20°C/68°F)
Blue - Black			
Red - Blue			

5.1.3 IPM Continuity Check

Turn off the power, let the large capacity electrolytic capacitors discharge completely, and dismount the IPM. Use a digital tester to measure the resistance between P and UVWN; UVW and N.

Digital tester		Normal resistance value	Digital tester		Normal resistance value
(+)Red	(-)Black		(+)Red	(-)Black	
P	N	∞	U	N	∞
	U		V		
	V	(Several MΩ)	W		(Several MΩ)
	W		(+)Red		

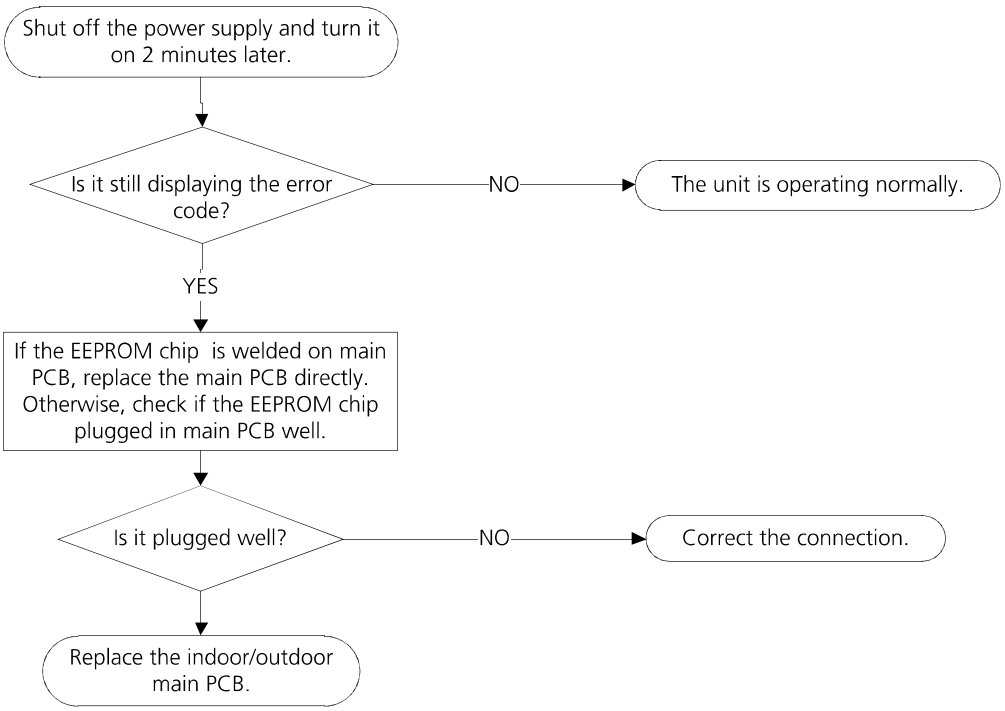
5.2 E0/F4/EA (EEPROM parameter error)

Description: Indoor or outdoor PCB main chip does not receive feedback from EEPROM chip.

Recommended parts to prepare:

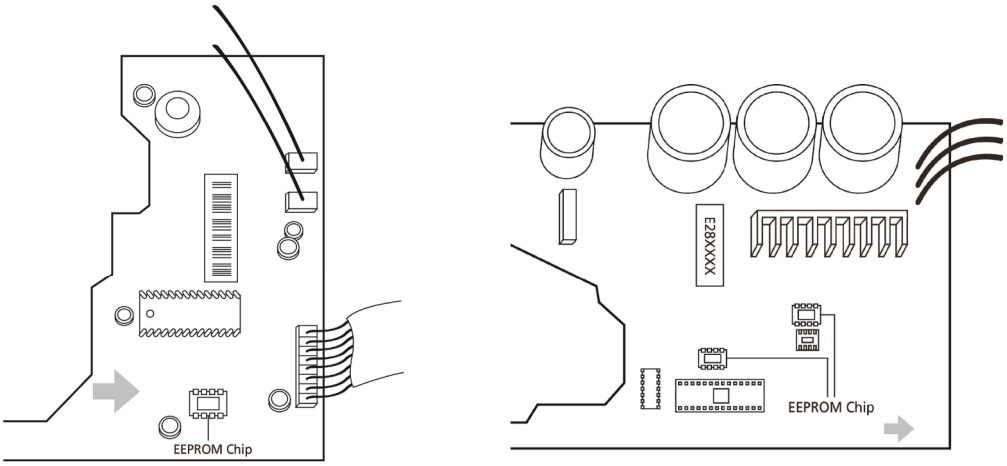
- Faulty indoor PCB
- Faulty outdoor PCB

Troubleshooting and repair:



Remarks:

The location of the EEPROM chip on the indoor and outdoor PCB is shown in the following two images:



Note: These images are for reference only.

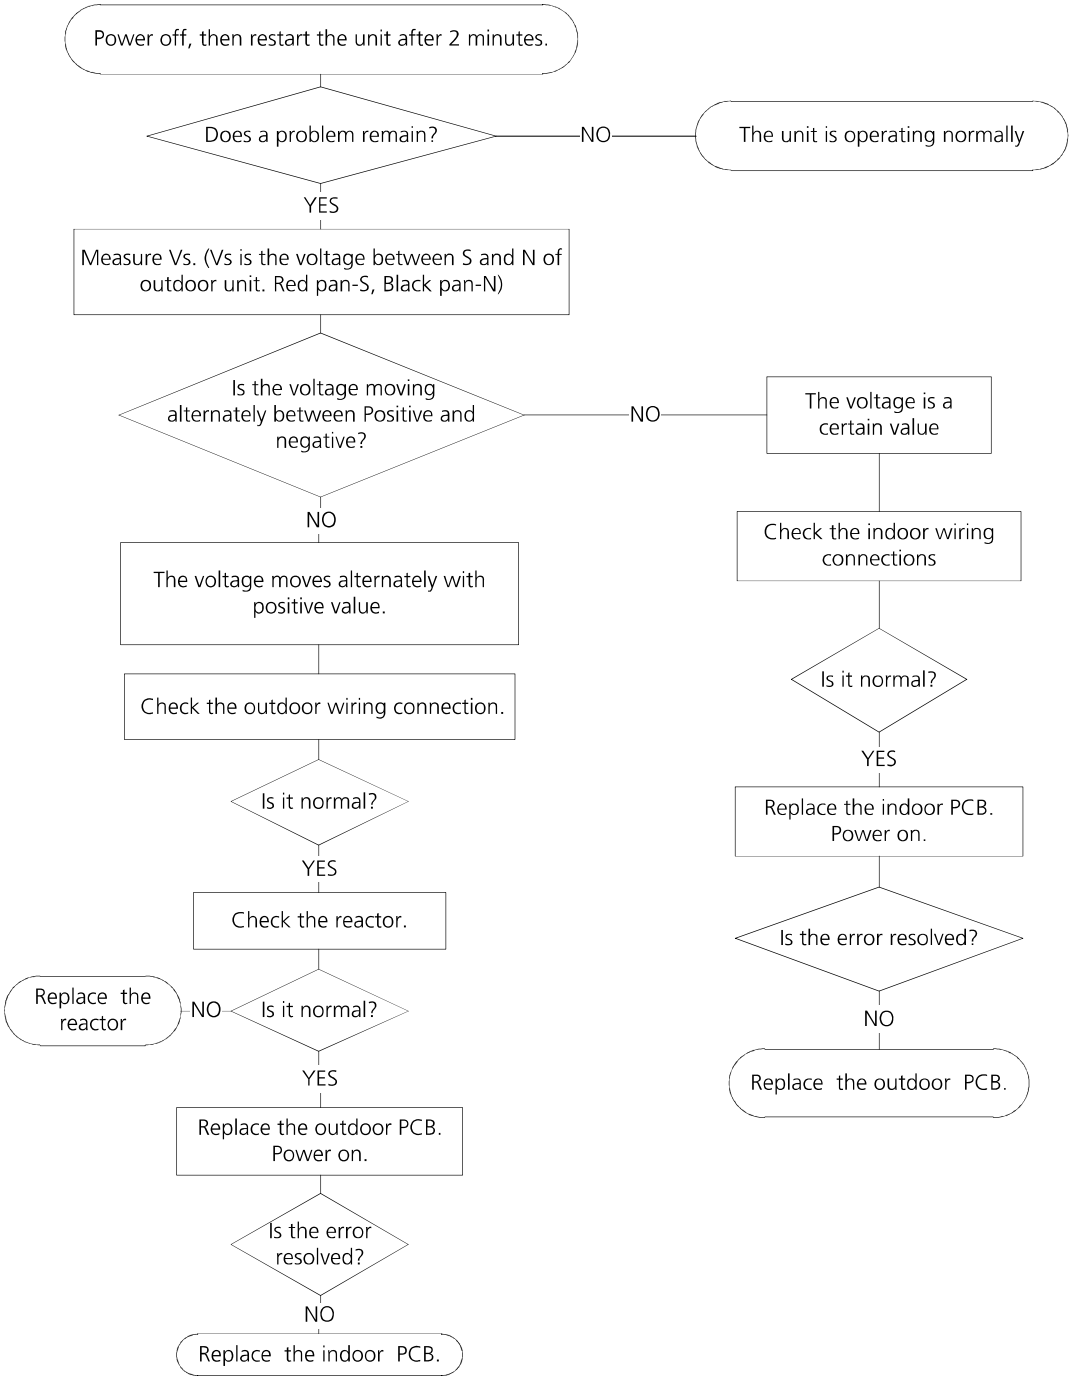
5.3 E1 (Indoor and outdoor unit communication error)

Description: The indoor unit has not received feedback from the outdoor unit for 110 seconds, four consecutive times.

Recommended parts to prepare:

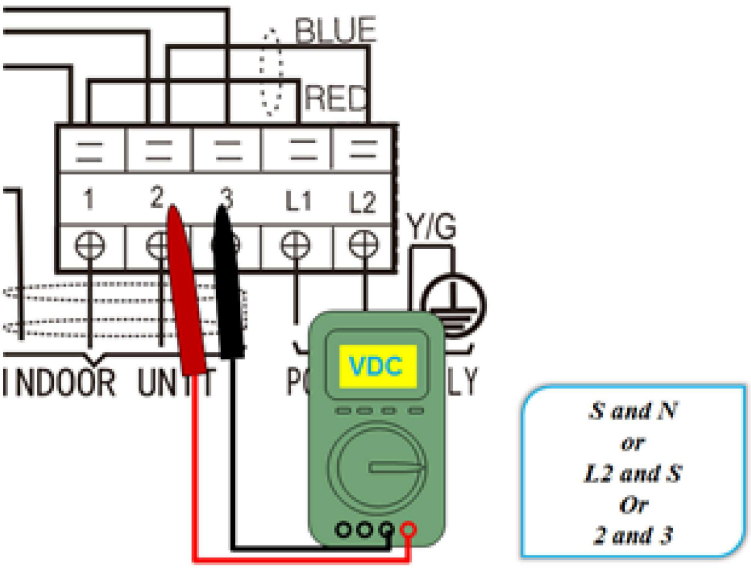
- Faulty indoor PCB
- Faulty outdoor PCB
- Faulty reactor

Troubleshooting and repair:



Remarks:

- Use a multimeter to test the DC voltage between 2 port and 3 port of outdoor unit. The red pin of multimeter connects with 2 port while the black pin is for 3 port.
- When AC is normal running, the voltage will move alternately between -25V to 25V.
- If the outdoor unit has malfunction, the voltage will move alternately with positive value.
- While if the indoor unit has malfunction, the voltage will be a certain value.



- Use a multimeter to test the resistance of the reactor which does not connect with capacitor.
- The normal value should be around zero ohm. Otherwise, the reactor must have malfunction and need to be replaced.

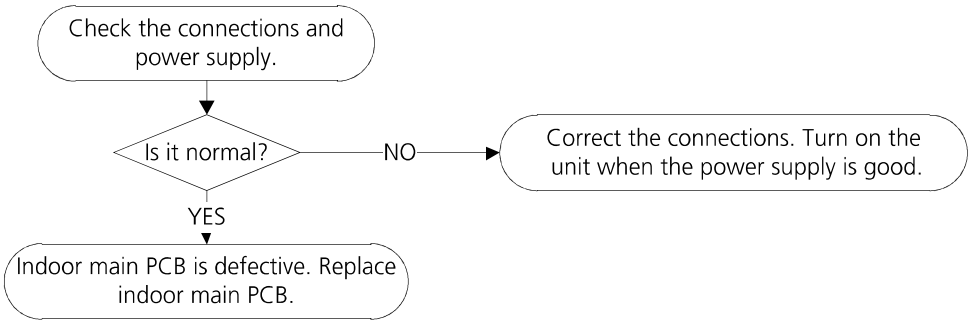
5.4 E2 (Zero crossing detection error diagnosis and solution)

Description: When PCB does not receive zero crossing signal feedback for 4 minutes or the zero crossing signal time interval is abnormal.

Recommended parts to prepare:

- Connection mistake
- PCB faulty

Troubleshooting and repair:



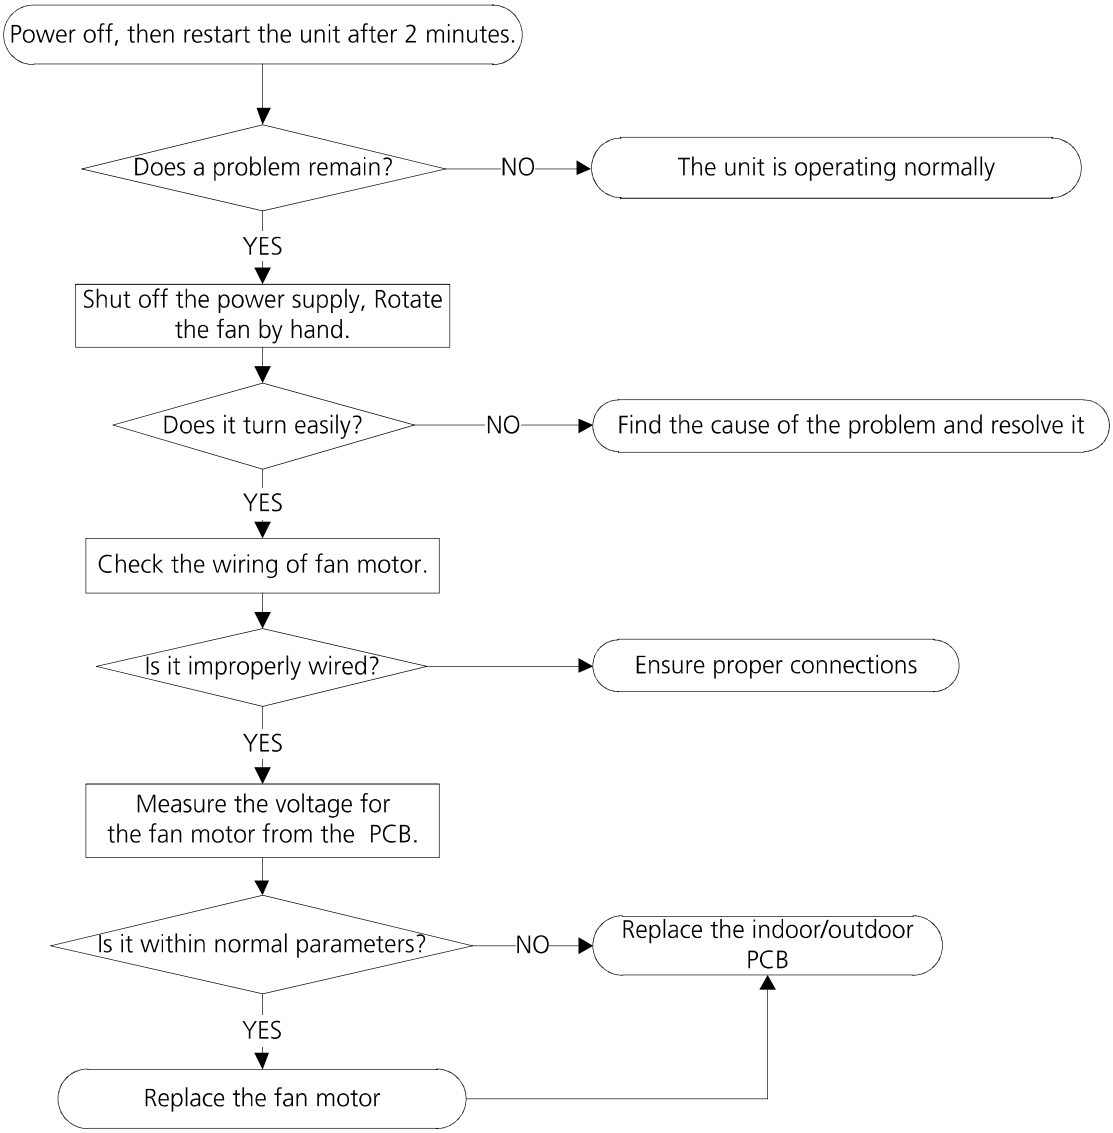
5.5 E3/F5(Fan speed has been out of control diagnosis and solution)

Description: When the indoor fan speed registers below 200RPM or over 2100RPM for an extended period of time, the unit will stop and the LED will display the failure(E3). When the outdoor fan speed registers below 200RPM or over 1500RPM for an extended period of time, the unit will stop and the LED will display the failure(F5).

Recommended parts to prepare:

- Wiring mistake
- Faulty fan assembly
- Faulty fan motor
- Faulty PCB

Troubleshooting and repair:



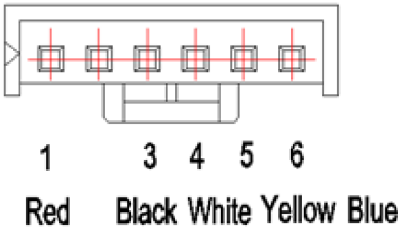
Index:

1. Indoor or Outdoor DC Fan Motor(control chip is in fan motor)

Power on and when the unit is in standby, measure the voltage of pin1-pin3, pin4-pin3 in fan motor connector. If the value of the voltage is not in the range showing in below table, the PCB must has problems and need to be replaced.

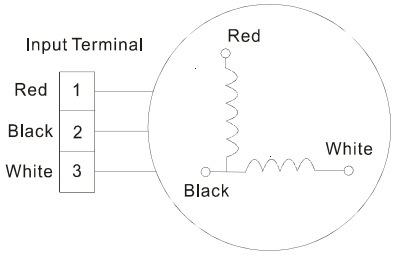
- DC motor voltage input and output (voltage: 220-240V~):

No.	Color	Signal	Voltage
1	Red	Vs/Vm	280V~380V
2	---	---	---
3	Black	GND	0V
4	White	Vcc	14-17.5V
5	Yellow	Vsp	0~5.6V
6	Blue	FG	14-17.5V



2. Indoor AC Fan Motor

Power on and set the unit running in fan mode at high fan speed. After running for 15 seconds, measure the voltage of pin1 and pin2. If the value of the voltage is less than 100V(208~240V power supply) or 50V(115V power supply), the PCB must has problems and need to be replaced.



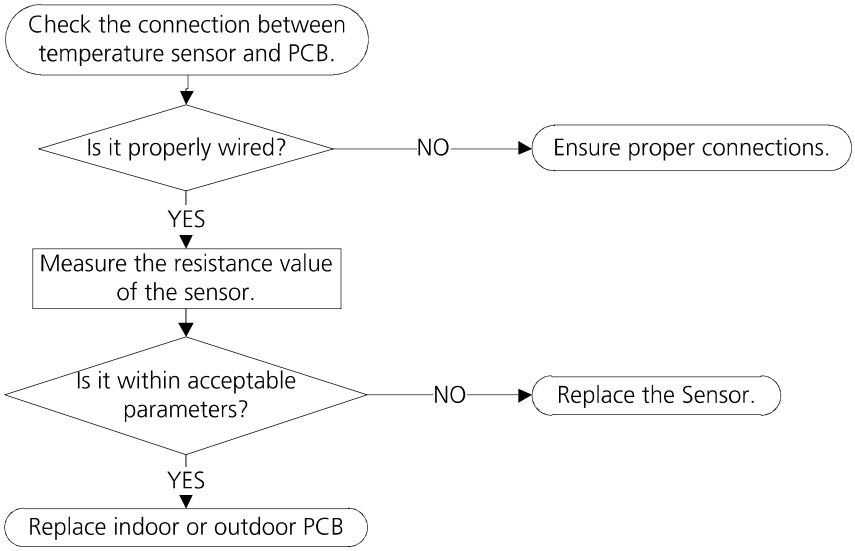
5.6 E4/E5/F1/F2/F3 (Open circuit or short circuit of temperature sensor diagnosis and solution)

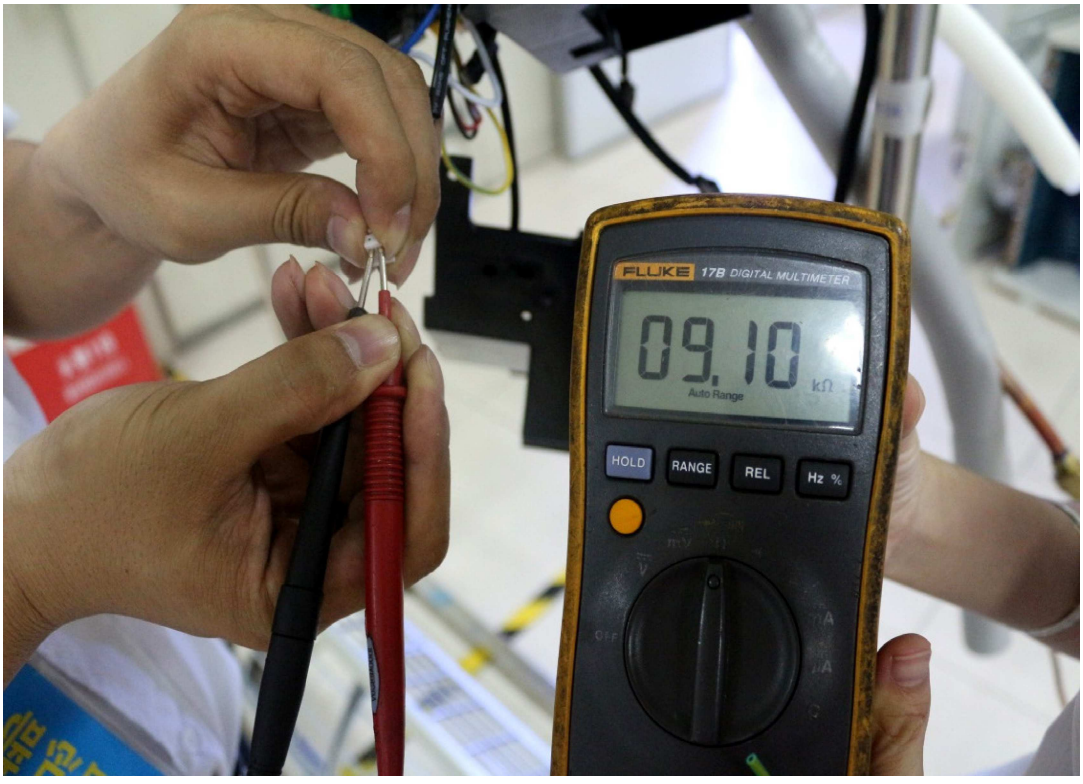
Description: If the sampling voltage is lower than 0.06V or higher than 4.94V, the LED will display the failure.

Recommended parts to prepare:

- Wiring mistake
- Faulty sensor
- Faulty PCB

Troubleshooting and repair:





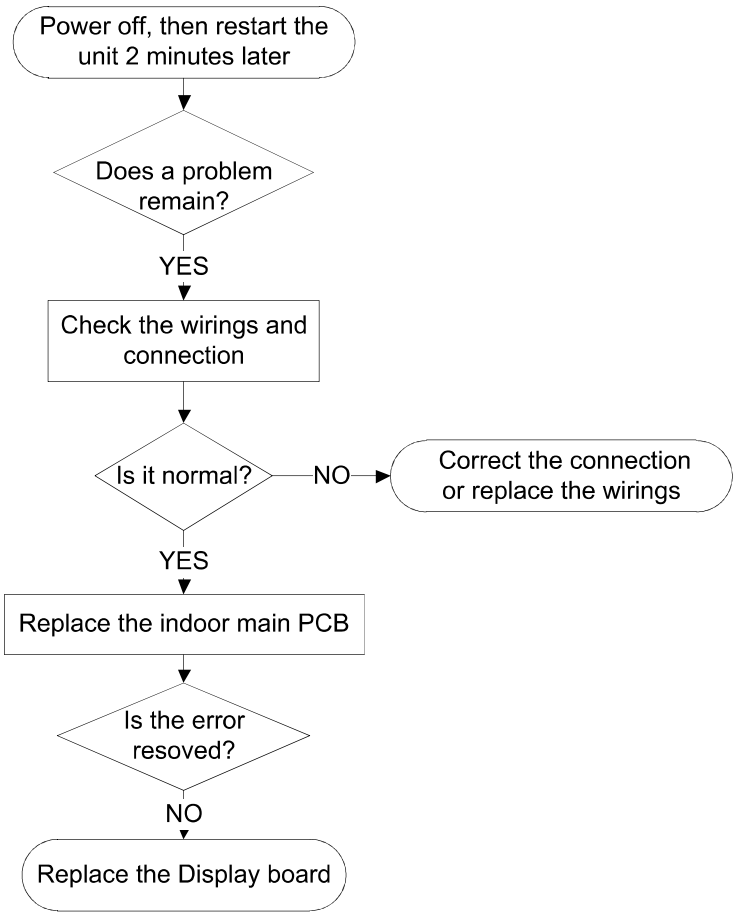
5.7 Eb(Communication error between the indoor PCB and display board)

Description: Indoor PCB does not receive feedback from Display board.

Recommended parts to prepare:

- Wiring mistake
- Faulty indoor PCB
- Display board malfunction

Troubleshooting and repair:

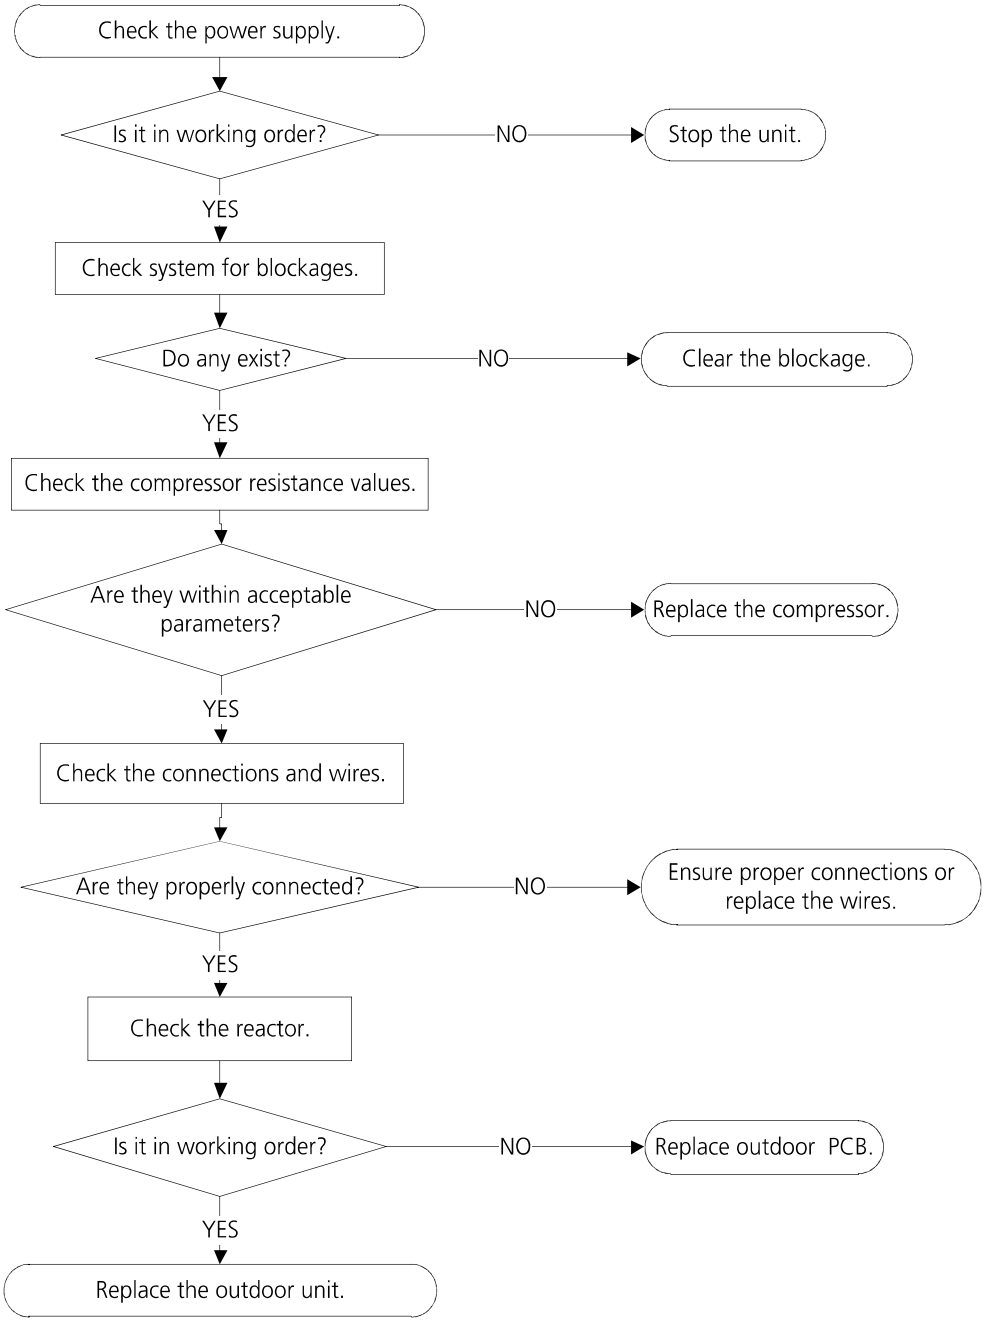


5.8 F0(Overload current protection diagnosis and solution)

Description: An abnormal current rise is detected by checking the specified current detection circuit.

Recommended parts to prepare:

- Power supply problems.
- System blockage
- Faulty outdoor PCB
- Wiring mistake
- Compressor malfunction



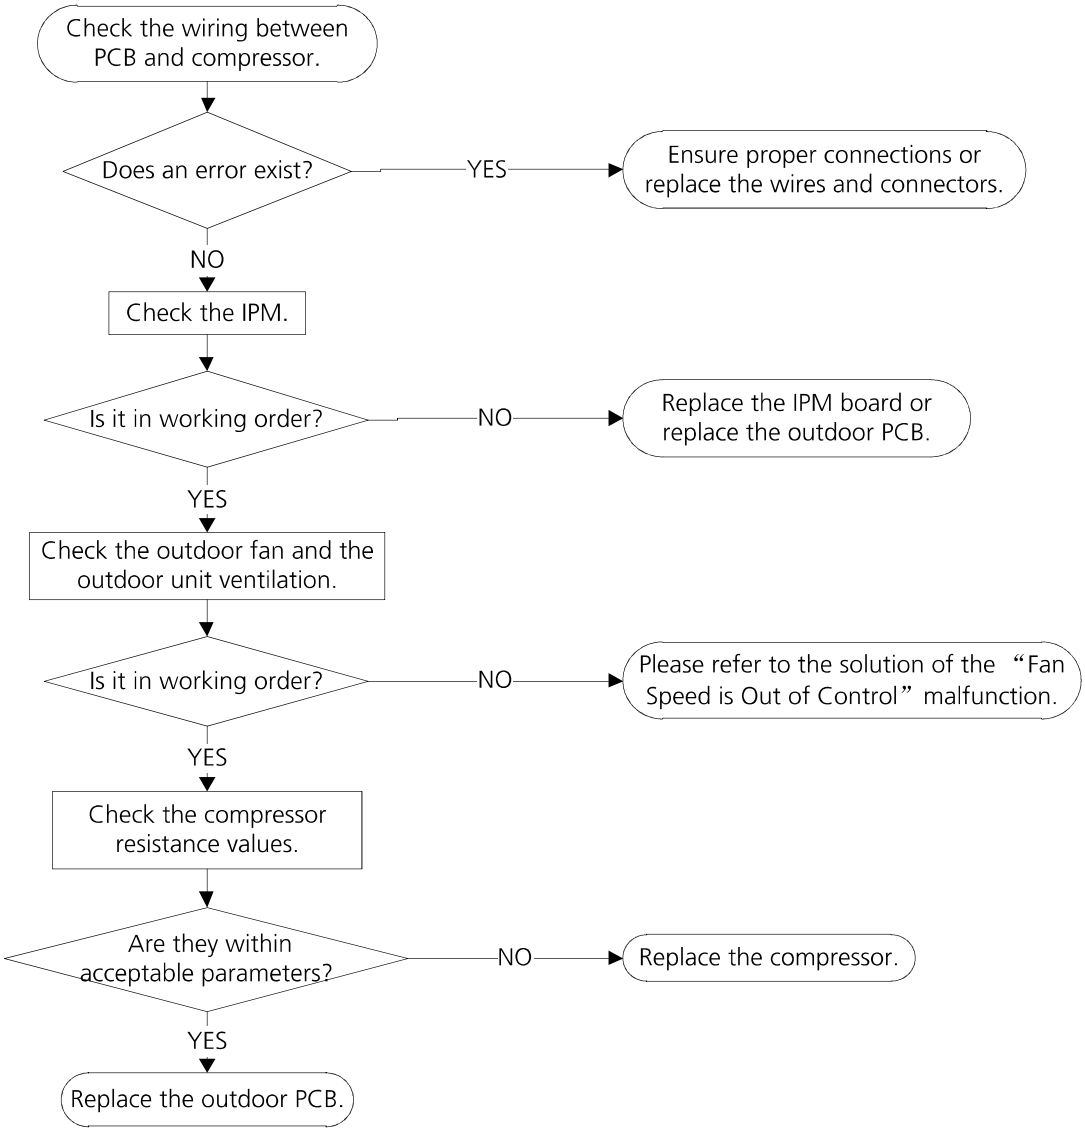
5.9 P0(IPM malfunction or IGBT over-strong current protection diagnosis and solution)

Description: When the voltage signal the IPM sends to the compressor drive chip is abnormal, the display LED shows "P0" and the AC turn off.

Recommended parts to prepare:

- Wiring mistake
- IPM malfunction
- Faulty outdoor fan assembly
- Compressor malfunction
- Faulty outdoor PCB

Troubleshooting and repair:



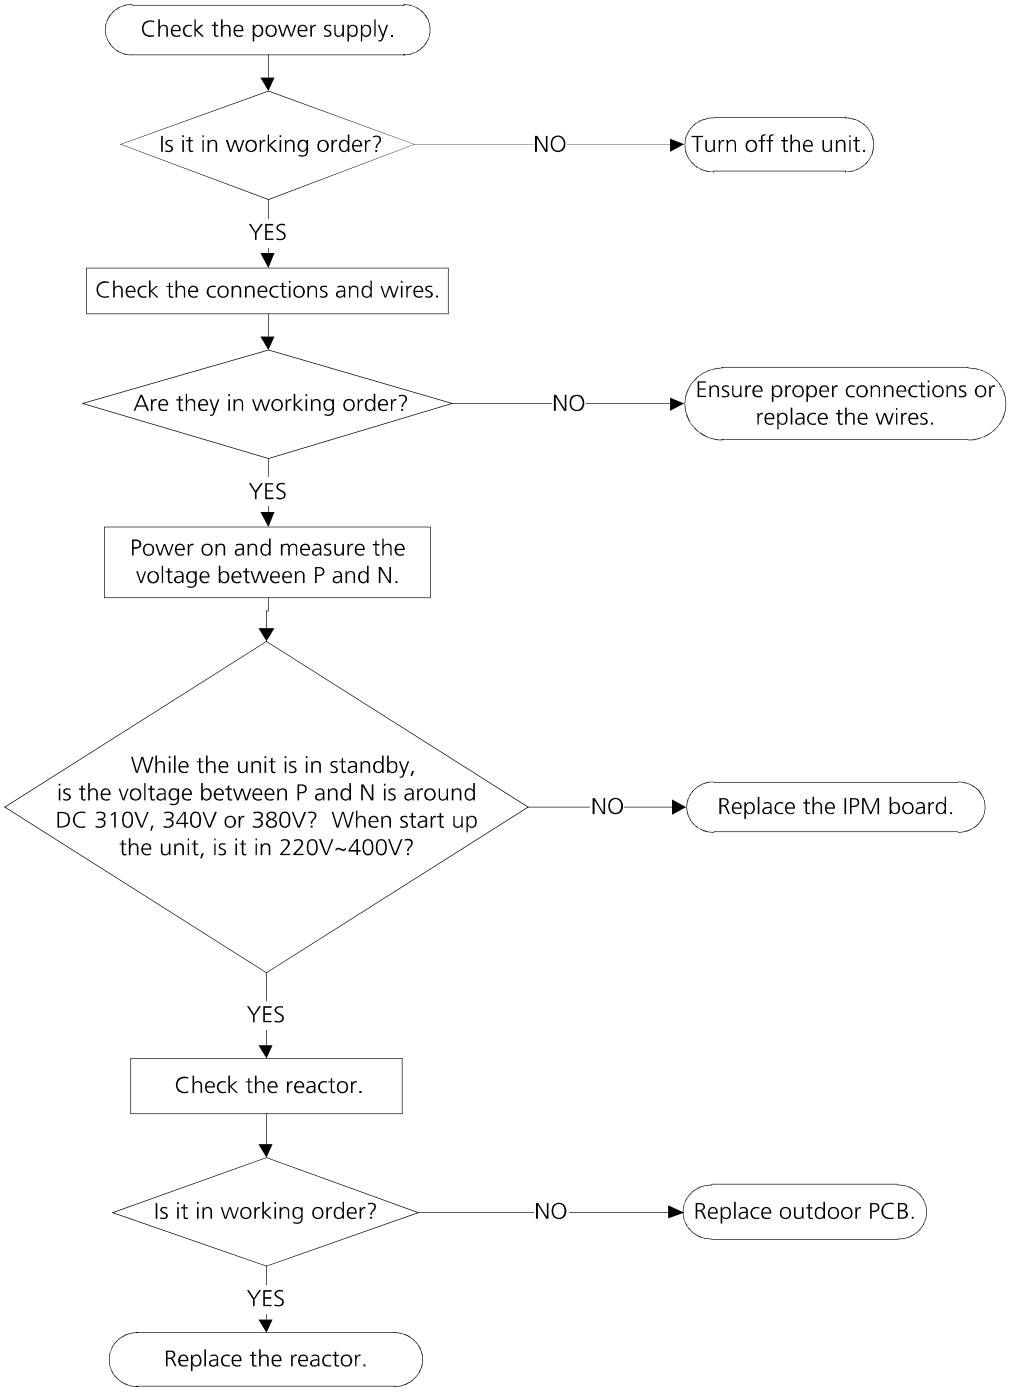
5.10 P1(Over voltage or too low voltage protection diagnosis and solution)

Description: Abnormal increases or decreases in voltage are detected by checking the specified voltage detection circuit.

Recommended parts to prepare:

- Power supply issues
- System leakage or blockage
- Faulty outdoor PCB

Troubleshooting and repair:



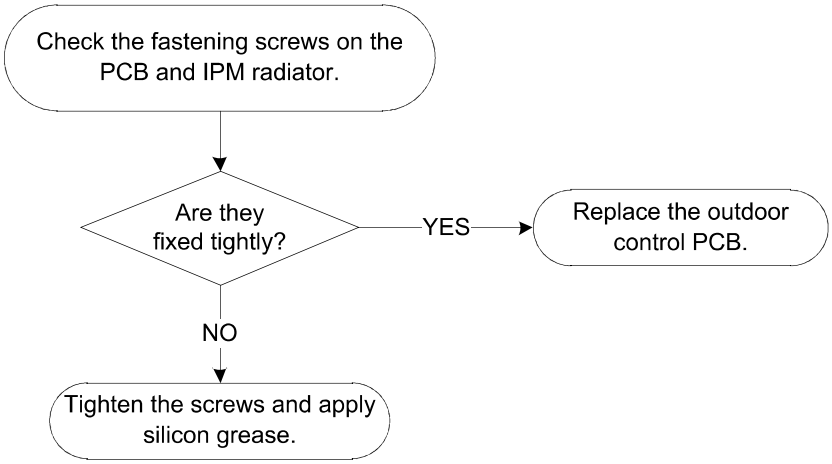
5.11 P2(High temperature protection of IPM module or compressor top diagnosis and solution)

Description: If the sampling voltage is not at 5V, the LED displays this failure code.

Recommended parts to prepare:

- Power supply issues
- System leakage or blockages
- Faulty outdoor PCB
- Connection problems

Troubleshooting and repair:



5.12 P4(Inverter compressor drive error diagnosis and solution)

Description: An abnormal inverter compressor drive is detected by a special detection circuit, including communication signal detection, voltage detection, compressor rotation speed signal detection and so on.

Recommended parts to prepare:

- Wiring mistake
- IPM malfunction
- Faulty outdoor fan assembly
- Compressor malfunction
- Faulty outdoor PCB
